Workshop
Advanced Data Modelling

Jane Marie Pareja

April 13, 2026

1 The Workshop

I have attended this workshop and it was about making an advanced Entity Relationship Diagram and database design. We started by mentioning about the Primary Keys, Foreign Keys, and intermediate tables. We then had a recap about the current entity diagram and the moved on how to make it more advanced like what factors to consider and which or what to add.

So in making an ERD, we need to follow 3 steps;

1. Identify entities
2. Name the attributes
3. Idetify the relationships between those entities

So the entities should be placed outside the box and an identifier should be at the top of the box, then the common attributes below the identifier. It is important to check the entries and should not have typos, and no surrogate identifiers.
So the next step after creating the ERD would be to translate the ERD into a database. A database should have;

- Primary Keys - unique values
- Foreign Keys - PK of another table

In a many-to-many relationships between tables, an intermediate table would be useful. Figure 1 shows the notes I have taken during the workshop.

2 Reflection

I learned in detail how to make the right ERD and how to identify the relationships between entities which would be very useful in my chosen topic, which is the Process Data in Organizations. Now I can make a detailed ERD in my design document to clearly illustrate the data model and database for my project.
